

EXP-12 End to End communication at transport layer

- Aim:
  - Part A: implement an echo client server app using TCP/UDP sockets
  - Implement a two way chat client server app using socket programming

- ~~Post~~ Algorithm:

PART-A

1. Create a TCP socket using
2. Bind the sockets to the server IP & port
3. Put the socket into listening mode.
4. Accept an incoming client connection using accept()
5. Read and echo the received data using write() & read()
6. Close the client

PART-B

1. Initialize socket bind to local port and listen.
2. Accept client connection
3. Enter a communication loop.
4. Close sockets on exit.

- Result:

The echo client server and chat client server applications were implemented using TCP socket programming APIs in C.
